

## Binksetmemory 8 Download

December 18, 2013 - [ \_\_asm \_\_cdecl \_\_declspec(dllexport) \_\_declspec(naked) void \_\_stdcall BinkSetMemory(int a1, void \_\_stdcall BinkSetMemory(int a2, ...); BinkSetMemory is a function that allows you to store a BinkBitString in memory. This is good because you don't need it, you only need one BinkBitString for all your purposes. In this code, I do it, but the BinkBitString will still be empty. I can write this if the BinkBitString is not empty: void \_\_stdcall BinkSetMemory(int a1, void \_\_stdcall BinkSetMemory(int a2, ...);
