* The following guidelines are based on the CS6 version of Photoshop. If you're using a different version of Photoshop or a version that uses a different editing system, the basic format of these guidelines may change. Use these as a general guideline, but use your knowledge of your specific version of Photoshop to adapt the steps. * These guidelines are based on a workstation that has 2GB of RAM and a 2.7GHz processor. Your experience may vary based on the specs of your computer. The following set of guidelines provides instructions for creating an outline around images and then creating a mask so you can use the mask to add layers and make changes. The following features are covered in this chapter: * Creating a new image * Working with layers * Saving and quitting * Using the Hue/Saturation dialog box * Adjusting the Levels * Adjusting the Curves * Using a Gradient Map * Customizing brushes # Create a New Image Before you begin any of the tasks in this chapter, create a new image. This is the starting point for all your edits. If you don't start with a new image, you will begin with a blank canvas. 1. **On the Home tab, choose Image** ⇒ **New**. The New dialog box appears (see Figure 11-1), where you can name your new image. You can find the File Type (bitmap or JPEG) option under the Options button. 2. **In the Name box, type a name and then press Enter (Return on a Mac)**. Figure 11-1: Start with a new image from the New dialog box. 3. **Under the Type: drop-down menu, choose either Bitmap or JPEG (Mac) or .jpg (Windows)**. Note that you may see a warning in the bottom-right corner of the New dialog box (see Figure 11-2). This warning appears only if you attempted to create a new file with the dimensions of a previously opened image. If you want to use a previously opened image, choose the appropriate option and click OK. In the following sections, you'll change the options in the New dialog box to have a smaller canvas for your new image and to save it in the JPEG format. It can also be used as a simple photo editor. Photoshop is Adobe's default software for creating, editing and retouching graphics. It is what you use every day to make images in your print or web projects. There are many people who use Photoshop to create memes, quote images, and make realistic emoji, but they don't know it can be a lot more than just that. It's one of the most used software with 60+ million registered users and counting. In this post, I'll show you why Photoshop is one of the most used software in the world, how you can use it to make memes, how to use Photoshop to create high quality images for your next design or web project, and the reasons why you should learn it. Think about it for a second. What are the most used software in the world? Photo editing software. If you really think about it, Photoshop is the most used photo editing software in the world. I already mentioned this above, but I'm repeating it because it's important. Why? Because a lot of people use Photoshop for other things than retouching photos. In this post, I'll show you how to use Photoshop to create your next meme, how to use it to create new high-quality images for your next design, how to use it for graphic and web design, how to use it for print design, and you will learn the most useful features and the main tools you need to work with. How to use Photoshop for Memes and Icons This is, by far, the most common thing people do when they use Photoshop. When you use Photoshop for a specific purpose, you have to figure out which tool you need to use. I'll show you how to make nice-looking, cute and colorful memes and icons in just a few minutes. You won't have to spend hours searching for a meme or icon template. That being said, I'll show you how to make memes and icons without a background. To make a meme with a background is as simple as typing the text and linking it to a free background image. To make an icon, you'll need a specific background, but it's really easy. I'll show you how to make nice- 05a79cecff

Q: How to find parameter dictionary on ASP.NET WebForms page? I have a generic handler on a server, and I need to access a parameter dictionary on that page, but I don't know how. I'll give an example, let say I have a page: /user.aspx?id=1 Inside that page, I have a link click me If that page is displayed on the server, I want to access the id 2 string id = Page.Request.QueryString["id"]; So I can use the id in the page to do whatever I need to do. But I don't want to create a new page for each user action, I want to create one generic page, so I want to get the id in the default page /user.aspx?id=1 And then in my handler, get the id string id = Page.Request.QueryString["id"]; A: A better way to do this is through an HttpModule which can hook into the pipeline and give you a chance to alter the request object, then write the new request to disk and make it visible to the next request. The HttpModule approach has the advantage of not requiring code anywhere else if you decide to change it to get a different value of the query string. public class MyHttpModule : IHttpModule { public void Init(HttpContext context) { } public void Dispose() { } public void InitRequest(HttpContext context, IHttpModule caller) { } public void BeginRequest(HttpContext context, IHttpModule caller) { } public void EndRequest(HttpContext context, IHttpModule caller) { } public void PostAuthenticateRequest(Object sender, EventArgs e) { } } You then need to register that in the web.config: And, in the actual handler: string id = (string)ctx.
